•
$$B_q(J^P=0^-) \ o \ \overline{b}q$$

•
$$D^*_q(J^P=1^-) \ o \ \overline{c}q$$

- Yields useful information for understanding the structure of the D^{*}_s meson.
- These decays provide possibility to calculate the elements of the CKM matrix and leptonic decay constants.
- Among the b decays, $b \rightarrow c$ transition is the most dominant transition.

 $\begin{array}{c} \text{Introduction}\\ B_q \to D_q^* \ell \nu \text{ transitions}\\ \text{Sum rules for the } B_q \to D_q^* \ell \nu \text{ transition form factors}\\ \text{Numerical Analysis} \end{array}$

$B_q \rightarrow D_q^* \ell \nu$ transitions

 The B_q → D^{*}_q transition proceeds by the b → c transition at the quark level

Effective hamiltonian:

$$H_{\text{eff}} = \frac{G_F}{\sqrt{2}} V_{cb} \,\overline{I} \,\gamma_\mu (1 - \gamma_5) \nu \,\overline{c} \,\gamma_\mu (1 - \gamma_5) b. \tag{1}$$

・ロト ・聞 ト ・ 国 ト ・ 国 ト …

Sandwiching the effective hamiltonian between initial and final meson states

$$M = \frac{G_F}{\sqrt{2}} V_{cb} \overline{I} \gamma_{\mu} (1 - \gamma_5) \nu < D_q^*(p', \varepsilon) | \overline{c} \gamma_{\mu} (1 - \gamma_5) b | B_q(p) > .$$
(2)

Both vector and axial part contribute to the matrix element

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

 $\begin{array}{c} \text{Introduction}\\ B_q \to D_q^* \ell \nu \text{ transitions}\\ \text{Sum rules for the } B_q \to D_q^* \ell \nu \text{ transition form factors}\\ \text{Numerical Analysis} \end{array}$

 Considering Lorentz and parity invariances, this matrix element can be parameterized in terms of the form factors in the following way:

$$< D_q^*(p',\varepsilon) \mid \overline{c}\gamma_{\mu}b \mid B_q(p) >= i \frac{f_V(q^2)}{(m_{B_q} + m_{D_q^*})} \varepsilon_{\mu\nu\alpha\beta} \varepsilon^{*\nu} p^{\alpha} p'^{\beta},$$
(3)

$$< D_q^*(p',\varepsilon) \mid \overline{c}\gamma_{\mu}\gamma_5 b \mid B_q(p) > = i \left[f_0(q^2)(m_{B_q} + m_{D_q^*})\varepsilon_{\mu}^* - \frac{f_+(q^2)}{(m_{B_q} + m_{D_q^*})}(\varepsilon^* p)P_{\mu} - \frac{f_-(q^2)}{(m_{B_q} + m_{D_q^*})}(\varepsilon^* p)q_{\mu} \right],$$
(4)

where $f_V(q^2)$, $f_0(q^2)$, $f_+(q^2)$ and $f_-(q^2)$ are the transition form factors and $P_\mu = (p + p')_\mu$, $q_\mu = (p - p')_\mu$

QCD Sum Rules

- Shifman & Vainshtein & Zakharov (SVZ),1979
- QCD sum rules is a framework which connects hadronic parameters with QCD parameters.
- Based on the QCD Lagrangian
- The correlation function is calculated in hadrons and quark-gluon languages
- The physical quantities are determined by matching these two representations of correlators

 $\begin{array}{c} \text{Introduction}\\ B_q \to D_q^* \ell \nu \text{ transitions}\\ \text{Sum rules for the } B_q \to D_q^* \ell \nu \text{ transition form factors}\\ \text{Numerical Analysis} \end{array}$

Phenomenological Par Theoretical Part

The correlation function

$$\Pi_{\mu\nu}^{V;A}(p^{2},p'^{2},q^{2}) = i^{2} \int d^{4}x d^{4}y e^{-ipx} e^{ip'y}$$

< 0 | $T[J_{\nu D_{q}^{*}}(y) J_{\mu}^{V;A}(0) J_{B_{q}}(x)] \mid 0 >$ (5)

where $J_{\nu D_q^*}(y) = \overline{q} \gamma_{\nu} c$ and $J_{B_q}(x) = \overline{b} \gamma_5 q$ are the interpolating currents of D_q^* and B_q mesons, respectively and $J_{\mu}^{V} = \overline{c} \gamma_{\mu} b$ and $J_{\mu}^{A} = \overline{c} \gamma_{\mu} \gamma_5 b$

Introduction Sum rules for the $B_q
ightarrow D_q^* \ell
u$ transition form factors

Theoretical Part

Theoretical Part

Figure: Feynman diagrams for $B_q \rightarrow D_q^* l \nu$ (q = s, d, u) transitions.

-

 $\begin{array}{c} \text{Introduction} \\ B_q \to D_q^* \ell \nu \text{ transitions} \\ \text{Sum rules for the } B_q \to D_q^* \ell \nu \text{ transition form factors} \\ \text{Numerical Analysis} \end{array}$

Phenomenological Par Theoretical Part

- The theoretical part of the correlation function is calculated by means of OPE, and up to operators having dimension d = 5, it is determined by the bare-loop (Fig. 1 a) and the power corrections (Fig. 1 b, c, d) from the operators with d = 3, $\langle \overline{\psi}\psi \rangle$, d = 4, $m_s \langle \overline{\psi}\psi \rangle$, d = 5, $m_0^2 \langle \overline{\psi}\psi \rangle$
- The QCD sum rules for the f_V, f₀, f₊ and f₋ is obtained by equating the phenomnological expression and the OPE expression and applying double Borel transformations with respect to the variables p² and p'²

 $\begin{array}{c} \text{Introduction}\\ B_q \to D_q^* \ell \nu \text{ transitions}\\ \text{Sum rules for the } B_q \to D_q^* \ell \nu \text{ transition form factors}\\ \text{Numerical Analysis} \end{array}$

Phenomenological Part Theoretical Part

$$f_{i}(q^{2}) = \kappa \frac{(m_{b} + m_{q})}{f_{B_{q}}m_{B_{q}}^{2}} \frac{\eta}{f_{D_{q}^{*}}m_{D_{q}^{*}}} e^{m_{B_{q}}^{2}/M_{1}^{2} + m_{D_{q}^{*}}^{2}/M_{2}^{2}}$$

$$\times [\frac{1}{(2\pi)^{2}} \int_{(m_{c} + m_{s})^{2}}^{s_{0}} ds' \int_{f(s')}^{s_{0}} ds \rho_{i}(s, s', q^{2}) e^{-s/M_{1}^{2} - s'/M_{2}^{2}}$$

$$+ \hat{B}(f_{i}^{(3)} + f_{i}^{(4)} + f_{i}^{(5)})] \qquad (9)$$

where $\eta = m_{B_q} + m_{D_q^*}$ for $i = V, \pm$ and $\eta = \frac{1}{m_{B_q} + m_{D_q^*}}$ for i = 0 are considered. Here $\kappa = +1$ for $i = \pm$ and $\kappa = -1$ for i = 0 and V

 To subtract the contributions of the higher states and the continuum, the quark-hadron duality assumption is used.

 $\begin{array}{c} \mbox{Introduction}\\ B_q \rightarrow D_q^* \, \ell \, \nu \mbox{ transitions}\\ \mbox{Sum rules for the } B_q \rightarrow D_q^* \, \ell \, \nu \mbox{ transitors}\\ \mbox{Numerical Analysis} \end{array}$

Phenomenological Part Theoretical Part

• The double Borel transformations

$$\hat{B}\frac{1}{r^{m}}\frac{1}{r'^{n}} \to (-1)^{m+n}\frac{1}{\Gamma(m)}\frac{1}{\Gamma(n)}e^{-m_{b}^{2}/M_{1}^{2}}e^{-m_{c}^{2}/M_{2}^{2}}\frac{1}{(M_{1}^{2})^{m-1}(M_{2}^{2})^{n-1}}.$$
(10)

• The f(s') is determined

$$-1 \leq \frac{2ss' + (s + s' - q^2)(m_b^2 - s - m_q^2) + (m_q^2 - m_c^2)2s}{\lambda^{1/2}(m_b^2, s, m_q^2)\lambda^{1/2}(s, s', q^2)} \leq +1.$$
(11)

The usual triangle function

$$\lambda(a, b, c) = a^2 + b^2 + c^2 - 2ac - 2bc - 2ab$$

 $B_q \rightarrow D_q^* \ell \nu$ transitions Sum rules for the $B_q \rightarrow D_q^* \ell \nu$ transition form factors Numerical Analysis

Form Factors Heavy Quark Effective Theory (HQET) Branching Ratio

 To extend of the results to whole physical region we look for a fit parameterizations

$$f_i(q^2) = \frac{f_i(0)}{1 + \alpha \hat{q} + \beta \hat{q}^2 + \gamma \hat{q}^3 + \lambda \hat{q}^4},$$
 (13)

where $\hat{q} = q^2/m_{B_q}^2$.

	f(0)	α	β	γ	λ
f_V	0.38	-2.53	2.77	-2.41	0.03
f ₀	0.18	-1.77	0.98	-0.23	-3.50
f_+	0.12	-2.90	3.66	-3.72	-1.69
f_	-0.15	-2.63	2.72	-0.99	-6.48

Table: Parameters appearing in the form factors of the $B_s \rightarrow D_s^*(2112)\ell\nu$ for $M_1^2 = 19 \text{ GeV}^2$, $M_2^2 = 5 \text{ GeV}^2$.
